

Megalac

Megalac is a rumen protected fat, combining natural plant oil (palm fatty acids) with calcium. It has an ME value of 33.25 MJ/kg DM. The calcium protects the fat from breaking down in the rumen, so unlike many other fats there is no negative effect on rumen function. The fat is then digested in the acidic lower gut, with near 100% efficiency. The cow then uses the energy in Megalac for milk production and performance. Megalac has the highest independently measured net energy value of any feedstuff. Megalac not only increases milk yield, but can also improve fertility and decrease the risk of acidosis.

Megalac is also suitable for feeding to ewes where it can play a key role in improving ewe milk quality, improving lamb performance from twins and triplets, improving reproductive performance and reducing the risk of twin lamb disease.
